Experiment - 5

Student Name: Amrit Dey UID: 23BCS12543

Branch: BE-CSE Section/Group: KRG_1A

Semester: 5th Date of Performance: 22/9/25

Subject Name: Advanced Database and Management System

Subject Code: 23CSP-333

1. Problem Description/Aim:

Medium-Problem Title: Generate 1 million records per ID in 'transaction_data' using generate_series() and random() ,create a normal view and a materialized view 'sales_summary' with aggregated metrics (total_quantity_sold , total_sales, total_orders) , and compare their performance and execution time.

Procedure (Step-by-Step):

- 1. Create a large dataset:
 - Create a table names transaction_data (id, value) with 1 million records. take id 1 and 2, and for each id, generate 1 million records in value column
 - Use Generate_series () and random() to populate the data.
- **2.** Create a normal view and materialized view to for sales_summary, which includes total_quantity_sold, total_sales, and total_orders with aggregation.
- **3.** Compare the performance and execution time of both.

Sample Output Description:

The transaction_data table has 2 million rows (1 million per ID) with random values. The normal view sales_summary computes aggregates on the fly, while the materialized view sales_summary_mv stores precomputed results. Queries on the materialized view are much faster, but it needs refreshing when data changes, whereas the normal view always shows up-to-date results.

Hard-Problem Title: Create restricted views in the sales database to provide summarized, non-sensitive data to the reporting team, and control access using DCL commands (GRANT and REVOKE).

Procedure (Step-by-Step):

1. Create restricted views-

DEPARTMENT OF

COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

- Define views that show only **aggregated sales data** (e.g., total_sales, total_orders) without exposing sensitive columns like customer details or payment info.
- 2. Assign access to reporting team(or client)-
 - -Use "GRANT SELECT ON view name TO reporting user; " to give access.
- 3. Revoke access if needed.
 - -Use "REVOKE SELECT ON view_name FROM reporting_user;" to remove access.
- 4. Verify access
 - Reporting users can query the view but cannot access base tables directly, ensuring security.

Sample Output Description:

The result shows the restricted view providing summarized sales data only like

- Columns shown are product_id,total_quantity_sold, total_sales, total orders
 - Columns hidden are Customer names, addresses, payment details

A reporting user querying the view sees something like:

- Product 101 5000 units sold, total sales Rs. 12,50,000,500 orders.
- Product 102 3200 units sold, total sales Rs. 8,60,000,320 orders.

When the user tries to query the base "sales_transactions" table directly, access is denied, enforcing security.

2. Objective: To design and implement secure, efficient data access mechanisms by creating large-scale transaction datasets, summarizing them through normal and materialized views for performance comparison, and enforcing restricted access to sensitive data using views and DCL commands.

3. SQL QUERY AND OUTPUTS -

------MEDIUM LEVEL PROBLEM-----

Create table TRANSACTION_DATA(id int,val decimal); INSERT INTO TRANSACTION_DATA(ID,VAL) SELECT 1,RANDOM() FROM GENERATE SERIES(1,1000000);

INSERT INTO TRANSACTION_DATA(ID,VAL)
SELECT 2,RANDOM()
FROM GENERATE_SERIES(1,1000000);
SELECT * FROM TRANSACTION DATA;

CREATE or REPLACE VIEW SALES_SUMMARY AS SELECT

ID,

COUNT(*) AS total_quantity_sold, sum(val) AS total_sales, count(distinct id) AS total_orders FROM TRANSACTION_DATA GROUP BY ID;

EXPLAIN ANALYZE
SELECT * FROM SALES SUMMARY;

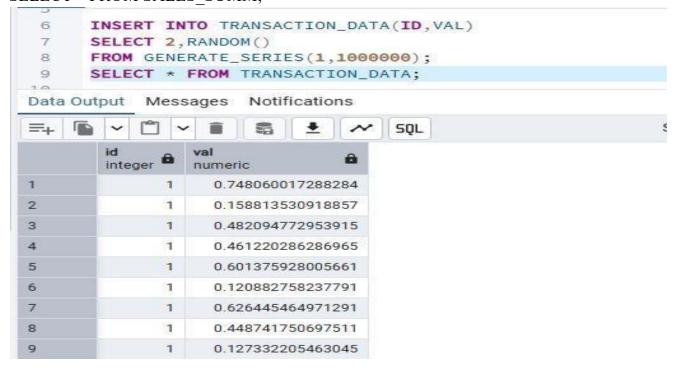

CREATE MATERIALIZED VIEW SALES_SUMM AS SELECT

ID,

COUNT(*) AS total_quantity_sold, sum(val) AS total_sales, count(distinct id) AS total_orders FROM TRANSACTION_DATA GROUP BY ID;

EXPLAIN ANALYZE

SELECT * FROM SALES SUMM;

OUTPUT -

As we can see that the execution time using the materialized view is very less as compared to the simple view's execution time.

------HARD PROBLEM -----

```
CREATE TABLE customer_data (
transaction_id SERIAL PRIMARY KEY,
customer_name VARCHAR(100), email
VARCHAR(100), phone VARCHAR(15),
payment_info VARCHAR(50), -- sensitive
order_value DECIMAL, order_date DATE
DEFAULT CURRENT_DATE
);
```

-- Insert sample data

INSERT INTO customer_data (customer_name, email, phone, payment_info, order_value) VALUES

('Mandeep Kaur', 'mandeep@example.com', '9040122324', '1234-5678-9012-3456', 500), ('Mandeep Kaur', 'mandeep@example.com', '9040122324', '1234-5678-9012-3456', 1000), ('Jaskaran Singh', 'jaskaran@example.com', '9876543210', '9876-5432-1098-7654', 700), ('Jaskaran Singh', 'jaskaran@example.com', '9876543210', '9876-5432-1098-7654', 300); CREATE OR REPLACE VIEW RESTRICTED_SALES_DATA AS SELECT
